

A CLARIFEYE PERSPECTIVE

Why AI delivery is so slow.

The blocker is rarely the model. It's the messy, undocumented knowledge that sits between an ambitious use case and a reliable assistant. Four failure modes explain most of it.

01

It's in people's heads.

The judgement calls, edge cases and pricing rules that make answers useful were never written down. Interviews don't scale, so that context never reaches the assistant.

02

Documents aren't AI-ready.

PDFs, decks and shared drives are scattered and duplicated. Tables, specs and price lists — the parts that carry the business rules — are the parts models get wrong.

03

Generic AI doesn't know you.

Foundation models don't know your catalogue, competitors or discount ladder. Stuffing context into a prompt is a demo trick, not a production system.

04

Nothing improves.

Wrong answers get logged as tickets, not knowledge gaps. Without versioning and human-approved changes, quality plateaus and the pilot flatlines.
