

Why is AI delivery so slow?

Three things are true about context inside every organization.

Business logic is not written down.

Most operational knowledge lives in people's heads, never captured anywhere the model can read.

What's true today won't be true next week.

Prices, policies and processes shift constantly — whatever was captured yesterday is already stale.

Knowledge is spread across a dozen places.

PDFs, emails, spreadsheets and Slack threads each hold a fragment — no single source an agent can query.

So AI delivery stays slow.

Nothing is written, nothing is current, nothing is centralized — every gap gets filled by hand.
